# End-of-Day Training Report

| | |
|---|---|
| **Trainee:** Atibali Saiyed | **Report Date:** 06 November 2026 |
| **Repository:** https://github.com/Atibali/Gateway-Training/tree/main/Week1/Day4 | **Coverage:** Week 1 — Part 1 and Part 2 Completed |

## 1. Objectives for the Day

Connect C# and OOP fundamentals Revision with future test automation, understand tester workflows and QA documents, and complete the Week 1 learning coverage.

## 2. QA Automation — Part 2

**Programming for Testers:** Revised the shared C# and OOP concepts from Part 1 and applied classes, objects, methods, properties and encapsulation in a simulated Login Testing Program. Created LoginPage and LoginTests classes to test valid and invalid login scenarios, understanding how classes and objects form the foundation of the Page Object Model (POM) used in future automation.

**Git for Testers:** Reviewed repositories, staging, commits, branches, pushing changes and meaningful commit messages. Test scripts and test data are version-controlled like product code.

**Tools:** Git/GitHub for practice code and a spreadsheet for initial test cases.

**QA Documentation**: Learned the purpose and intended readers of Test Strategy, Test Plan, Test Case and Test Report. Understood how these documents support test planning, execution and reporting. Prepared 10 test cases for a simple Login Page in an Excel spreadsheet using a standard template, including Test Case ID, Scenario, Preconditions, Test Steps, Test Data, Expected Result, Actual Result, Status and Remarks.

## 3. Login Page Test Cases

Prepared 10 login test cases in a spreadsheet using: Test Case ID, Scenario, Preconditions, Steps, Test Data, Expected Result, Actual Result.

## 4. Week 1 Completion Summary — Part 1 and Part 2

Completed the planned Week 1 coverage: C#/.NET fundamentals, methods and exceptions, date/time handling, OOP and SOLID principles, Git/GitHub workflow, QA mindset, SDLC/STLC, manual and static testing, test levels/types, QA documentation and the login test-case exercise.

**Key Learning Outcome:** Understood how programming, OOP, version control and QA documentation support structured manual testing and provide a foundation for future test automation and POM.
