QA Tools, Test Management and Testing Techniques

Jira — Project and issue management — Learned about Jira projects and issue types, including Epic, Story, Task, Bug and Sub-task. Covered workflows, Scrum and Kanban boards, filters, and basic JQL queries for tracking and managing work.

Test management — Xray and Zephyr — Learned the purpose of Xray and Zephyr for test management. Covered creating and organizing test cases, grouping tests into Test Sets, running Test Executions, and recording results such as Pass, Fail and Blocked.

Chrome DevTools — Browser debugging — Practised inspecting browser Console errors and warnings, using the Network tab to examine Fetch/XHR requests, and understanding HTTP status codes, request headers and responses. Learned how HAR files can be exported to support debugging.

Bug evidence and defect reporting — Covered capturing screenshots and screen recordings as evidence, the structure of a defect report, the difference between severity and priority, and the defect lifecycle. Practised preparing structured bug reports with clear reproduction steps and supporting evidence.

Software testing techniques — Studied Equivalence Partitioning (EP) to divide inputs into valid and invalid groups; Boundary Value Analysis (BVA) to test minimum, maximum and boundary values; and Decision Table Testing to cover combinations of conditions and their expected actions.

Practical exercises — Prepared HelpDesk test cases using EP, BVA and Decision Table techniques. Created five sample bug reports for a HelpDesk application and practised recording expected results, actual results, severity and priority.

JavaScript and TypeScript Revision

JavaScript revision

- DOM manipulation, selectors and event handling.
- textContent versus innerHTML; working with attributes, classes and DOM elements.
- JavaScript objects, arrays and common array methods.
- Functions, classes and modules.
- Promises, async/await and error handling.
- Playwright fundamentals and the Page Object Model (POM).
- HTTP methods, status codes, headers and JSON.

TypeScript revision

- Basic types, type annotations and type inference.
- Arrays, tuples and object types.
- The difference between any and unknown.
- Interfaces and type aliases.
- Union types and literal types.
- Typed functions and classes.
- Enums and generics.
- Type narrowing and utility types.

Summary

By the end of day, I completed the topics covered across QA topics of the training. I practiced using Jira concepts for project and issue tracking, learned the basics of test management with Xray and Zephyr, used Chrome DevTools for browser and network debugging, and studied defect evidence, bug reporting, and core test design techniques including EP, BVA and Decision Tables.

I also revised JavaScript and TypeScript fundamentals required for automation testing, including DOM handling, objects, arrays, functions, classes, modules, asynchronous programming, Playwright basics, POM, TypeScript types, interfaces, generics and type narrowing. Practical work included HelpDesk test cases, five sample bug reports, and the listed JavaScript and TypeScript practice files.
